Summary :

-Development of a master plan for underground utilization of site area of 300ha

-Development of the detailed planning for the underground space for 3 key districts for underground utilization

Services : Conceptual planning, Detailed planning

Time of services : 2007

Ningbo city has developed as port city where Japanese envoy to China in the Thang Dynasty came and went, and called Ningbo in ancient times.

This planning area is located at the inner city of Ningbo City. The themes of the project were the following: program adjustment of the subway construction which is about to break ground and the large-scale redevelopment of 3 sites, and measures against traffic jams in chronic situation.

We analyzed the problems in the traffic planning and reviewed the planning for the under path that effectively utilizes the underground space.

As for the key areas for the underground utilization included in the redevelopment planning, we prepared the planning for the integration of the subway and architecture, the planning for attractive underground commercial area and the underground parking space network linked to the traffic planning for its adjacent area. We also developed the guideline for the planned use of the underground space.
